

Table, Supplemental Digital Content 3: Association of baseline eGFR (MDRD) with all-cause mortality in HIV-infected WIHS participants. (using MDRD equation for creatinine)				
	Total Number	Death rate (per 1,000 person-years) (95% CI)	Unadjusted HR (95% CI)	Adjusted HR (95% CI)
Creatinine				
• >90 mL/min/1.73m ²	494	19.1 (15.6, 23.2)	Reference	Reference
• 60-90 mL/min/1.73m ²	350	22.5 (18.1, 28.0)	1.19 (0.89, 1.60), p=0.25	1.35 (0.98, 1.86), p=0.065
• < 60 mL/min/1.73m ²	64	38.7 (25.7, 58.2)	2.12 (1.34, 3.34), p=0.0012	2.44 (1.49, 3.99), p=0.00037
<p>* Fully adjusted Cox models control for age, ethnicity, traditional kidney risk factors[†], and HIV-related risk factors[‡] (all measured at baseline, except for CD4+ count and HIV RNA, which are time-updated)</p> <p>† Traditional kidney risk factors include smoking, hypertension, diabetes, and ACR</p> <p>‡ HIV-related risk factors include CD4+ count, HIV RNA, and HCV</p>
